

4 Steps for Lecture Video Production with SLM – Editorial

1. Enter content into SLM

Description	Risks
Prompt AI to generate content for this component	- Content not clear from pre-production step - Unavailable/ late content from pre-production

2. Review and edit SLM output and include visual suggestions

Description	Risks
- Clean up AI language - Fact-check	- AI hallucinations - Possible hallucinations mean thorough review is required - Office distractions mean extra time needed - Suggesting visuals may take time if source material/pre-production hasn't delivered - Possible delays down the line if visuals are expected to be in-house animations or on-site live recordings - No relevant visuals available through stock sources

3. Language/copy edit including creation of text-only and HeyGen-ready versions

Description	Risks
- Focus on language / style / logic - No extensive fact checking	- No designated copy editor available: - Done by another scientific editor, leading to bottlenecks - OR - - Scientific editors doing their own copy edits

4. HeyGen production

Description	Risks
Use HeyGen software to produce video based on text version created in previous step	- Editors must be taught how to do this - If the video is the authoritative “document” moving forward, changes become much more difficult to track / implement. (On-screen text, bullet points, script adjustments based on ID input, etc.)

4 Steps for Lecture Video Production with GPT – Editorial

1. Enter content into GPT

Description	Risks
Prompt AI to generate content for this component	- Content not clear from pre-production step - Unavailable/late content from pre-production means extra time for research needed - Different prompting from each team with different expectations results in different types of content produced (differences in tone, vocabulary, length between scripts)

2. Edit GPT output and include visual suggestions

Description	Risks
- Fact-check while still necessary - Clean up AI language - Add visuals from pre-production in correct places - Add suggestions for slides	- Routine AI hallucinations mean extra time for fact-checking - Office distractions mean extra time needed - Suggesting visuals may take time if source material/pre-production hasn't delivered - Possible delays down the line if visuals are expected to be in-house animations or on-site live recordings - Delays if no relevant visuals available through stock sources

3. Language/copy edit including creation of text-only and HeyGen-ready versions

Description	Risks
- Focus on language / style / logic - No extensive fact checking - Text-only and HeyGen-ready version produced after approval by scientific editor	- No designated copy editor available: - Done by another scientific editor, leading to bottlenecks - OR - - Scientific editors doing their own copy edits - Some questions from language editor require scientific editor input / approval.

4. HeyGen production

Description	Risks
Use HeyGen software to produce video based on text version created in previous step	- Editors must be taught how to do this - If the video is the authoritative "document" moving forward, changes become much more difficult to track / implement. (On-screen text, bullet points, script adjustments based on ID input, etc.)
