### Application — AI-Native Product Builder

Dear Hiring Team,

I am applying to join the AI-native product team you are building at ATCP. I am a **builder first**: my default output is a working prototype in stakeholders' hands — shipped with Cursor, Claude, and modern web stacks — not a slide deck waiting for engineering capacity. That is the work I want to do at one of Germany's largest commercial real estate platforms: turn tenant and operations friction into testable software, fast.

As **Head of Production** at the German Academy of Digital Education (DADB), I ran parallel cross-functional productions end to end and built an **AI-assisted operations dashboard** that structured production data into live KPIs — so build/buy/kill calls were based on evidence, not gut feel. The pattern maps directly to property operations: many stakeholders, tight deadlines, and decisions that only get better when real users react to something concrete.

Why I fit this builder role: **Discovery through building** — I use AI-native coding workflows to ship functional PoCs while the problem is still fresh. Examples include **Occupied VFX** (browser GPU pipeline, idea to release in one month), **Skyhaven** (Tauri + React + Three.js desktop widget, live demo), and production tooling on my portfolio at [artjomnaninjan.vercel.app](https://artjomnaninjan.vercel.app) — all personally built and updated within the last 90 days.

---

**Stakeholder translation** — I translate between business intent and technical reality without becoming a bottleneck: from property managers and editorial leads to developers and external partners (including Tesla and TU Berlin). I am comfortable reading APIs, sketching data models, writing SQL, debugging my own prototypes, and deploying to Vercel.

**Portfolio of small bets** — I kill ideas that do not show signal and double down on what users actually use. I am not looking for a coordinator role; I measure my week in artifacts shipped. I work in English and German, am based in Berlin, and am genuinely curious about how leases, service charges, move-ins, and tenant communications work in practice — I learn fastest by putting demos in front of the people who live the process.

I would welcome a conversation to walk through live demos and discuss how I can help ATPC move tenant-facing and internal ideas into working PoCs quickly, then hand only what proves its value to your integration engineering team. I am available for interviews in Berlin or by video call at short notice.

My CV, project portfolio, and working prototypes are attached and available at [artjomnaninjan.vercel.app](https://artjomnaninjan.vercel.app) and [github.com/Aaroncxc](https://github.com/Aaroncxc).

Kind regards

Artjom Naninjan
